

Audio3 Warbler

£1950

Audio3 Ltd. is owned and operated by hearing research scientists who study hearing loss (NIHL). We are dedicated to reducing the prevalence of hearing loss and improving the diagnosis and treatment of hearing loss. Our primary concern is hearing health. The Warbler is unique among audiometers; it is an easy to use, beautifully made and features ling sounds and narrow-band music stimuli in addition to warble tones and fresh noise. It is also highly accurate.

- Warble tones for testing thresholds in the sound field
- Fresh noise for narrow band signals that are frequency- specific at higher presentation levels
 - Ling sounds for hearing aid testing with children
 - 5 familiar songs to motivate responses in children with attention and communication difficulties. These have filtered bands for frequency specific results
- Scales of frequencies to assess any perceptual distortion across frequencies
