

Audio3 Warbler

PRICE: £2,500 + VAT

Audio3 and Chear have come together to develop this sound field device for testing infants and children. The Warbler is unique among audiometers; it is easy to use, beautifully made and features Ling sounds and narrow-band music stimuli, in addition to warble tones and FRESH noise, a hood to remove all visual cues – when pressing signals. It is also highly accurate.

The Warbler has:

- Warble tones for testing thresholds in the sound field
- FRESH noise for narrow-band signals that are frequency- specific at higher presentation levels
- Ling speech sounds for assessing detection and discrimination levels
- 5 familiar songs to motivate responses in children with attention and communication difficulties. These have filtered bands for frequency specific results
- Scales of frequencies to assess any perceptual distortion across frequencies
